Disclosures

Interval Fund Structure Risk
The Fund is structured as an unlisted closed-end interval fund. Limited liquidity is provided to shareholders only through the Fund's quarterly offers to repurchase between 5% and 25% of its outstanding shares at net asset value, subject to applicable law. The Fund currently expects to offer to repurchase 5% of outstanding shares per quarter. There is no secondary market for the Fund's shares and none is expected to develop. There is no guarantee that an investor will be able to tender all of their requested Fund shares in a quarterly Fund repurchase offer. Investors should consider shares of the Fund to be an illiquid investment. The Fund's ability to be fully invested and achieve its investment objective may be affected by the need to fund its quarterly repurchase obligations.

Please see the Fund's prospectus for a more complete discussion of the Fund's Principal Risks.

Risk
The Fund is subject to the general risks associated with investing in **debt securities** and **loan instruments**, including the risk of default. **Market** risk may affect a single issuer, sector of the economy, industry or the market as a whole. The Fund may invest substantially in **illiquid securities**, subjecting the Fund to liquidity risk, which exists when investments are difficult to purchase or sell at the time that the Fund would like or at the price that the Fund believes such investments are currently worth. Illiquid securities may become harder to value, especially in changing markets. **Credit** risk is the risk that the value of loans or other debt instruments may decline if the borrower or the issuer thereof defaults or otherwise becomes unable or unwilling, or is perceived to be unable or unwilling, to honor its financial obligations, such as making payments to the Fund when due. A rise in **interest rates** may result in a price decline of fixed-income instruments held by the fund, negatively

impacting its performance and NAV. Falling rates may result in the fund investing in lower yielding debt instruments, lowering the fund's income and yield. These risks may be heightened for longer maturity and duration securities. **Counterparty** risk is the risk that a counterparty to a transaction in a financial instrument held by the Fund or by a special purpose or structured vehicle invested in by the Fund may become insolvent or otherwise fail to perform its obligations. As a result, the Fund may obtain no or limited recovery of its investment, and any recovery may be significantly delayed. **Mortgage- and asset-backed securities** are affected by interest rates, financial health of issuers/originators, creditworthiness of entities providing credit enhancements and the value of underlying assets, particularly **subprime** mortgage securities. **Alternative (or private) credit investments** are not traded in public markets and are illiquid, such that the Fund may not be able to resell some of its holdings for extended periods, which may be several years, or at the price at which the Fund is valuing its investments. The issuers of private credit investment will often be leveraged, as a result of recapitalization transactions, and may not be rated by national credit rating agencies. Investing in alternative credit markets, including asset-based finance (ABF) and alternative lending ABF, involves specialized techniques and risks. **Valuation** risk is the risk that the sales price the Fund could receive, or actually receives, for any particular investment may differ from the Fund's valuation of the investment, particularly for securities that are not publicly traded (e.g., private investments) or trade in thin or volatile markets, debt securities sold in amounts less than institutional-sized lots (typically referred to as odd lots) or securities that are valued using a fair value methodology that produces an estimate of the fair value of the security/instrument. The Fund's use of **leverage** allows for investment exposure in excess of net assets, thereby magnifying volatility of returns and risk of loss. **Non-investment-grade** securities (high-yield or junk bonds) are volatile and carry more risk to principal and income than investment-grade securities. Investing in **derivatives** is a specialized activity that involves special risks, which may result in significant losses. **Prepayment and extension** risk exists because the timing of payments on a loan, bond or other investment may accelerate when interest rates fall or decelerate when interest rates rise which may reduce investment opportunities and potential returns. As a **non-diversified** fund, fewer investments could have a greater effect on performance.
